As

an engineer or manager, we all facing challenges in a cross-functional among design, manufacturing, production and business environments around sustainability and green. To design a manufacturing process, we must consider:

- What are the goals?
- What are the constraints?
- What are the knowns and unknowns?
- Which are feasible solutions?
- How the solution is validated?
- How can one apply technical and business knowledge to finalize an optimum solution plan considering increased productivity, quality, sustainability, reliability, agility, resilience, and best practices with rapid time to production and value? The list can go on and on.

Our

challenges may be:

- Design products with manufacturability and sustainability
- Prepare manufacturing plans to reduce waste and save energy,
- Prepare manufacturing process integrated to internet and data analytics
- Increase productivity of an existing manufacturing process,
- Improve product quality and minimize defects,
- Apply new manufacturing technologies, or
- Simply to understand a traditional manufacturing process, etc.

The goal of this *Manufacturing Engineering Handbook* is to provide readers with essential knowledge needed to build products with the highest quality at the lowest cost in the shortest possible time. With this handbook, you'll have access to information on conventional and modern technologies, manufacturing processes and operations management that will assist you to achieve the goals.
